

Comfort for All-Day Compliance

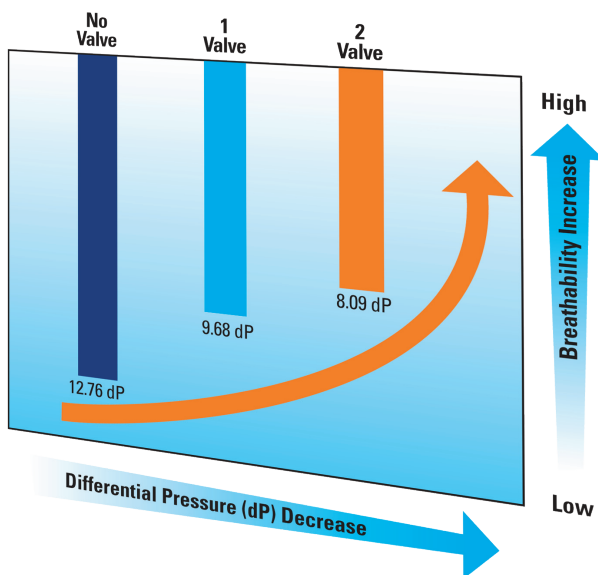

KLEENGUARD* M10 Particulate Respirator with Dual Valves

Now you can take a big breath and release it with ease when you use the KLEENGUARD* M10 Particulate Respirator with Dual Valves. A specially designed valve on each side of the mask releases exhaled air efficiently while blowing air downward and away from eyewear to reduce fogging. Two valves increase the area through which exhalation can occur. The more valves you have, the easier it is to breathe comfortably.

Breathability

Breathability is measured by differential pressure, or dP. The dP is the difference in air pressure on the inside vs. the outside respirator fabric covering during the air exchange which naturally happens when a person breathes. The lower the dP, the more breathable the respirator.

What a difference a valve makes!

37% more breathable than a respirator with no valves

Increases easy breathing by 16% compared to a single valve model
